

Docker Hands-On Assignment

Everything You Need to Know About Docker

Objective

Master Docker fundamentals by building, running, and managing containers. Learn Docker networking, volumes, and image creation through hands-on practice.

Prerequisites

- Docker installed on your machine (Docker Desktop for Mac/Windows or Docker Engine for Linux)
- Basic command line knowledge
- Text editor of your choice

```
ubuntu@ip-172-31-35-192:~$  
ubuntu@ip-172-31-35-192:~$ docker version  
Client:  
Version:      27.5.1  
API version:  1.47  
Go version:   go1.22.2  
Git commit:   27.5.1-0ubuntu3~24.04.2  
Built:        Mon Jun  2 11:51:53 2025  
OS/Arch:      linux/amd64  
Context:      default  
  
Server:  
Engine:  
Version:      27.5.1  
API version:  1.47 (minimum version 1.24)  
Go version:   go1.22.2  
Git commit:   27.5.1-0ubuntu3~24.04.2  
Built:        Mon Jun  2 11:51:53 2025  
OS/Arch:      linux/amd64  
Experimental: false  
containerd:  
Version:      1.7.27  
GitCommit:    1.7.27~ubuntu1~24.04.1

ubuntu@ip-172-31-35-192:~$ docker compose version  
Docker Compose version v2.39.4
```

Part 1: Docker Basics (30 minutes)

Task 1.1: Running Your First Containers

1. Pull and run basic containers:

```
docker run -d -t --name my-alpine alpine
docker run -d -t --name my-busybox busybox
```

```
ubuntu@ip-172-31-35-192:~$ docker run -d -t --name my-alpine alpine
440d89e9c8a3e93c732c720b04d73ac0c2a1f236f15bfa8a89285ca9a0dcffae
ubuntu@ip-172-31-35-192:~$ docker run -d -t --name my-busybox busybox
ba7dafab9048980c0634badfad10b18f565718152c8f26a941ea4450314ad0e3
ubuntu@ip-172-31-35-192:~$ |
```

2. List all containers:

```
docker ps
docker ps -a
```

```
ubuntu@ip-172-31-35-192:~$ docker ps
CONTAINER ID   IMAGE     COMMAND   CREATED   STATUS    PORTS   NAMES
ba7dafab9048   busybox   "sh"      26 minutes ago   Up 26 minutes           my-busybox
440d89e9c8a3   alpine    "/bin/sh" 26 minutes ago   Up 26 minutes           my-alpine
ubuntu@ip-172-31-35-192:~$ docker ps -a
CONTAINER ID   IMAGE     COMMAND   CREATED   STATUS    PORTS   NAMES
ba7dafab9048   busybox   "sh"      26 minutes ago   Up 26 minutes           my-busybox
440d89e9c8a3   alpine    "/bin/sh" 26 minutes ago   Up 26 minutes           my-alpine
ubuntu@ip-172-31-35-192:~$ |
```

3. Check downloaded images:

```
docker image ls
```

```
ubuntu@ip-172-31-35-192:~$ docker image ls
REPOSITORY    TAG       IMAGE ID       CREATED        SIZE
nginx          latest    41f689c20910   6 weeks ago    192MB
hello-world    latest    1b44b5a3e06a   6 weeks ago    10.1kB
alpine         latest    9234e8fb04c4   2 months ago   8.31MB
busybox        latest    0ed463b26dae   12 months ago  4.43MB
ubuntu@ip-172-31-35-192:~$ |
```

Questions to Answer:

Q: What's the difference between `docker ps` and `docker ps -a`?

`docker ps` shows only running containers.

`docker ps -a` shows all running as well as exited containers.

Q: Why are Alpine and BusyBox images so small?

They contain only the required binaries and libraries, without extra tools or packages.

Task 1.2: Container Interaction

1. Execute commands in running containers:

```
docker exec -t my-alpine ls /
docker exec -t my-busybox ps aux
```

```
ubuntu@ip-172-31-35-192:~$ docker exec -t my-alpine ls /
bin dev etc home lib media mnt opt proc root run sbin srv sys tmp usr var
ubuntu@ip-172-31-35-192:~$ docker exec -t my-busybox ps aux
PID USER TIME COMMAND
1 root 0:00 sh
7 root 0:00 ps aux
ubuntu@ip-172-31-35-192:~$ |
```

2. Open interactive shell sessions:

```
docker exec -it my-alpine sh
# Inside container: run `whoami`, `pwd`, `ls -la`
# Type `exit` to leave
```

```
ubuntu@ip-172-31-35-192:~$ docker exec -it my-alpine sh
/ # whoami
root
/ # pwd
/
/ # ls -la
total 64
drwxr-xr-x 1 root root 4096 Sep 24 16:48 .
drwxr-xr-x 1 root root 4096 Sep 24 16:48 ..
-rwxr-xr-x 1 root root 0 Sep 24 16:48 .dockerenv
drwxr-xr-x 2 root root 4096 Jul 15 10:42 bin
drwxr-xr-x 5 root root 360 Sep 24 16:48 dev
drwxr-xr-x 1 root root 4096 Sep 24 16:48 etc
drwxr-xr-x 2 root root 4096 Jul 15 10:42 home
drwxr-xr-x 6 root root 4096 Jul 15 10:42 lib
drwxr-xr-x 5 root root 4096 Jul 15 10:42 media
drwxr-xr-x 2 root root 4096 Jul 15 10:42 mnt
drwxr-xr-x 2 root root 4096 Jul 15 10:42 opt
dr-xr-xr-x 184 root root 0 Sep 24 16:48 proc
drwx----- 1 root root 4096 Sep 24 17:17 root
drwxr-xr-x 3 root root 4096 Jul 15 10:42 run
drwxr-xr-x 2 root root 4096 Jul 15 10:42 sbin
drwxr-xr-x 2 root root 4096 Jul 15 10:42 srv
dr-xr-xr-x 13 root root 0 Sep 24 16:48 sys
drwxrwxrwt 2 root root 4096 Jul 15 10:42 tmp
drwxr-xr-x 7 root root 4096 Jul 15 10:42 usr
drwxr-xr-x 11 root root 4096 Jul 15 10:42 var
/ # exit
ubuntu@ip-172-31-35-192:~$ |
```

3. Container lifecycle management:

```
docker stop my-alpine
docker start my-alpine
docker rm -f my-busybox
```

```

ubuntu@ip-172-31-35-192:~$
ubuntu@ip-172-31-35-192:~$ docker stop my-alpine
my-alpine
ubuntu@ip-172-31-35-192:~$ docker start my-alpine
my-alpine
ubuntu@ip-172-31-35-192:~$ docker rm -f my-busybox
my-busybox
ubuntu@ip-172-31-35-192:~$ docker ps -a

```

CONTAINER ID	IMAGE	COMMAND	CREATED	STATUS	PORTS	NAMES
440d89e9c8a3	alpine	"/bin/sh"	30 minutes ago	Up 18 seconds		my-alpine

```

ubuntu@ip-172-31-35-192:~$ |

```

Deliverable: Take screenshots of your container interactions and note the differences between Alpine and BusyBox.

Part 2: Docker Networking (45 minutes)

Task 2.1: Default Bridge Network

1. Run Nginx container:

```
docker run -d --name nginx-default nginx:latest
```

2. Inspect the container:

```
docker inspect nginx-default
```

```
# Look for NetworkSettings section
```

```

ubuntu@ip-172-31-35-192:~$
ubuntu@ip-172-31-35-192:~$ docker run -d --name nginx-default nginx:latest
60b0c74f33f2d2ce1e06d9c7413b59ab292d5ccea15a9669d53e6d0b424abdd
ubuntu@ip-172-31-35-192:~$ docker inspect nginx-default

        }
      }
    }
  }
}
ubuntu@ip-172-31-35-192:~$ |

```

3. Test connectivity:

```

docker exec -it nginx-default curl localhost:80
# Try accessing from host (this should fail):
curl localhost:80

```

```

ubuntu@ip-172-31-35-192:~$
ubuntu@ip-172-31-35-192:~$ docker exec -it nginx-default curl localhost:80
<!DOCTYPE html>
<html>
<head>
<title>Welcome to nginx!</title>
<style>
html { color-scheme: light dark; }
body { width: 35em; margin: 0 auto;
font-family: Tahoma, Verdana, Arial, sans-serif; }
</style>
</head>
<body>
<h1>Welcome to nginx!</h1>
<p>If you see this page, the nginx web server is successfully installed and
working. Further configuration is required.</p>

<p>For online documentation and support please refer to
<a href="http://nginx.org/">nginx.org</a>.<br/>
Commercial support is available at
<a href="http://nginx.com/">nginx.com</a>.</p>

<p><em>Thank you for using nginx.</em></p>
</body>
</html>
ubuntu@ip-172-31-35-192:~$ curl localhost:80
curl: (7) Failed to connect to localhost port 80 after 0 ms: Couldn't connect to server
ubuntu@ip-172-31-35-192:~$ |

```

Task 2.2: Port Forwarding

1. Run Nginx with port mapping:

```

docker rm -f nginx-default

```

```
docker run -d -p 8080:80 --name nginx-exposed nginx:latest
```

```
ubuntu@ip-172-31-35-192:~$ docker rm -f nginx-default
nginx-default
ubuntu@ip-172-31-35-192:~$ docker run -d -p 8080:80 --name nginx-exposed nginx:latest
405a0e53e595b7015751b356ca1d424e0992f5d4a4c34a87d19918832eb33ac6
ubuntu@ip-172-31-35-192:~$ docker ps -a
CONTAINER ID   IMAGE     COMMAND                  CREATED        STATUS        PORTS                               NAMES
405a0e53e595   nginx:latest   "/docker-entrypoint..."  41 seconds ago   Up 40 seconds   0.0.0.0:8080->80/tcp, [::]:8080->80/tcp   nginx-exposed
440d89e9c8a3   alpine        "/bin/sh"                 34 minutes ago   Up 4 minutes                               my-alpine
ubuntu@ip-172-31-35-192:~$ |
```

2. Test access:

```
# From your host machine:
curl localhost:8080
```

```
ubuntu@ip-172-31-35-192:~$ curl localhost:8080
<!DOCTYPE html>
<html>
<head>
<title>Welcome to nginx!</title>
<style>
html { color-scheme: light dark; }
body { width: 35em; margin: 0 auto;
font-family: Tahoma, Verdana, Arial, sans-serif; }
</style>
</head>
<body>
<h1>Welcome to nginx!</h1>
<p>If you see this page, the nginx web server is successfully installed and
working. Further configuration is required.</p>

<p>For online documentation and support please refer to
<a href="http://nginx.org/">nginx.org</a>.<br/>
Commercial support is available at
<a href="http://nginx.com/">nginx.com</a>.</p>

<p><em>Thank you for using nginx.</em></p>
</body>
</html>
ubuntu@ip-172-31-35-192:~$ |
```

Task 2.3: Custom Bridge Network

1. Create custom network:

```
docker network create my-network
docker network ls
```

```
ubuntu@ip-172-31-35-192:~$ docker network create my-network
4d3ba47532230a93364a3158a81e11cf7aedefdab4ebca6de4bf9bd81f1c6b87
ubuntu@ip-172-31-35-192:~$ docker network ls
NETWORK ID     NAME      DRIVER    SCOPE
6b10a79c36df   bridge    bridge    local
b163633679fd   host      host      local
4d3ba4753223   my-network bridge    local
acf4669decbe   none      null      local
ubuntu@ip-172-31-35-192:~$ |
```

2. Run containers in custom network:

```
docker run -d --network my-network --name web-server nginx:latest
docker run -it --network my-network --name client alpine sh
```

Test name resolution:

```
# Inside the Alpine container:
ping web-server
wget -qO- http://web-server
```

```
ubuntu@ip-172-31-35-192:~$ docker run -d --network my-network --name web-server nginx:latest
01a4a001a6f609b6b7bbd3af2148dbc010fec741fd62a17eaecec6d4f43bc5d9
ubuntu@ip-172-31-35-192:~$ docker run -it --network my-network --name client alpine sh
/ # ping web-server
PING web-server (172.18.0.2): 56 data bytes
64 bytes from 172.18.0.2: seq=0 ttl=64 time=0.086 ms
64 bytes from 172.18.0.2: seq=1 ttl=64 time=0.067 ms
^Z[1]+  Stopped                  ping web-server
/ # wget -qO- http://web-server
<!DOCTYPE html>
<html>
<head>
<title>Welcome to nginx!</title>
<style>
html { color-scheme: light dark; }
body { width: 35em; margin: 0 auto;

</style>
</head>
<body>
<h1>Welcome to nginx!</h1>
<p>If you see this page, the nginx web server is successfully installed and
working. Further configuration is required.</p>

<p>For online documentation and support please refer to
<a href="http://nginx.org/">nginx.org</a>.<br/>
Commercial support is available at
<a href="http://nginx.com/">nginx.com</a>.</p>

<p><em>Thank you for using nginx.</em></p>
</body>
</html>
/ # |
```

Questions to Answer:

Q: Why can containers ping each other by name in custom networks but not in the default bridge?

Default bridge → No name resolution (must use container IP).

Custom bridge → Built-in DNS allows containers to ping each other by name.

Q: What happens when you try to access the web server from your host machine in the custom network?

We cannot reach container because port is not published. In order to reach the container we have to publish the port using -p.

Part 3: Docker Volumes (30 minutes)

Task 3.1: Bind Mounts

1. Create a directory on your host:

```
mkdir shared-logs
```

2. Run containers with bind mount:

```
docker run -d -v $(pwd)/shared-logs:/app/logs --name logger1 alpine tail -f /dev/null
docker run -d -v $(pwd)/shared-logs:/app/logs --name logger2 busybox tail -f /dev/null
```

```
ubuntu@ip-172-31-35-192:~$ mkdir shared-logs
mkdir: cannot create directory 'shared-logs': File exists
ubuntu@ip-172-31-35-192:~$ ls -lrt
total 4
drwxrwxr-x 2 ubuntu docker 4096 Sep 24 14:17 shared-logs
ubuntu@ip-172-31-35-192:~$ docker run -d -v $(pwd)/shared-logs:/app/logs --name logger1 alpine tail -f /dev/null
a17724b82ad33ba652382f5e91bf3cd07d0ffe590b73ca87cb32d77a2f37e5bf
ubuntu@ip-172-31-35-192:~$ docker run -d -v $(pwd)/shared-logs:/app/logs --name logger2 busybox tail -f /dev/null
848b3600d2d0c4c9fb73af826bcb21459c02a22897fe5871169bfc52fec8e054
ubuntu@ip-172-31-35-192:~$ cd shared-logs/
ubuntu@ip-172-31-35-192:~/shared-logs$ ls -lrt
total 0
```

3. Create files from containers:

```
docker exec logger1 sh -c "echo 'Log from container 1' > /app/logs/container1.log"
docker exec logger2 sh -c "echo 'Log from container 2' > /app/logs/container2.log"
```

4. Verify file sharing:

```
# Check from host:
ls shared-logs/
cat shared-logs/*.log
# Check from containers:
docker exec logger1 ls /app/logs/
docker exec logger2 ls /app/logs/
```

```
ubuntu@ip-172-31-35-192:~/shared-logs$
ubuntu@ip-172-31-35-192:~/shared-logs$
ubuntu@ip-172-31-35-192:~/shared-logs$ docker exec logger1 sh -c "echo 'Log from container 1' > /app/logs/container1.log"
ubuntu@ip-172-31-35-192:~/shared-logs$ docker exec logger2 sh -c "echo 'Log from container 2' > /app/logs/container2.log"
ubuntu@ip-172-31-35-192:~/shared-logs$ ls shared-logs/
ls: cannot access 'shared-logs/': No such file or directory
ubuntu@ip-172-31-35-192:~/shared-logs$ cd ..
ubuntu@ip-172-31-35-192:~$ ls shared-logs/
container1.log  container2.log
ubuntu@ip-172-31-35-192:~$ cat shared-logs/*.log
Log from container 1
Log from container 2
ubuntu@ip-172-31-35-192:~$ docker exec logger1 ls /app/logs/
container1.log
container2.log
ubuntu@ip-172-31-35-192:~$ docker exec logger2 ls /app/logs/
container1.log
container2.log
ubuntu@ip-172-31-35-192:~$ |
```

Task 3.2: Docker Volumes

1. Create and use Docker volume:

```
docker volume create app-data
docker volume ls
docker volume inspect app-data
```

```

ubuntu@ip-172-31-35-192:~$
ubuntu@ip-172-31-35-192:~$ docker volume create app-data
app-data
ubuntu@ip-172-31-35-192:~$ docker volume ls
DRIVER      VOLUME NAME
local       app-data
ubuntu@ip-172-31-35-192:~$ docker volume inspect app-data
[
  {
    "CreatedAt": "2025-09-24T17:35:06Z",
    "Driver": "local",
    "Labels": null,
    "Mountpoint": "/var/lib/docker/volumes/app-data/_data",
    "Name": "app-data",
    "Options": null,
    "Scope": "local"
  }
]
ubuntu@ip-172-31-35-192:~$ |

```

2. Mount volume in containers:

```

docker run -d --mount source=app-data,target=/data --name data1 alpine tail
-f /dev/null
docker run -d --mount source=app-data,target=/data --name data2
nginx:latest

```

```

ubuntu@ip-172-31-35-192:~$
ubuntu@ip-172-31-35-192:~$ docker run -d --mount source=app-data,target=/data --name data1 alpine tail -f /dev/null
cb39e42f6702d9a72919c1ea9f3a4f85d08b9fcb5b7ec530f67ba6d92673cf96
ubuntu@ip-172-31-35-192:~$ docker run -d --mount source=app-data,target=/data --name data2 nginx:latest
4b8d844d0c5a8d110340de533da122dde673ab6ffbe7d86ca5768103d05c9f06
ubuntu@ip-172-31-35-192:~$ |

```

3. Test data persistence:

```

docker exec data1 sh -c "echo 'Persistent data' > /data/test.txt"
docker exec data2 cat /data/test.txt

```

```

ubuntu@ip-172-31-35-192:~$ docker exec data1 sh -c "echo 'Persistent data' > /data/test.txt"
ubuntu@ip-172-31-35-192:~$ docker exec data2 cat /data/test.txt
Persistent data

```

Data Persistence: When would you choose bind mounts over Docker volumes and vice versa?

Ans:

- Bind mounts are used for development and direct file access; Docker volumes used for production and managed persistence.
- Bind mounts need specific hostfile path. Docker volumes means docker will manage the storage life cycle

Part 4: Building Docker Images (60 minutes)

Task 4.1: Create a Flask Application

1. Create project directory:

```
mkdir flask-docker-app
cd flask-docker-app
```

2. Create application files:

app.py:

```
from flask import Flask, jsonify
import os

app = Flask(__name__)

@app.route('/')
def hello():
    return jsonify({
        "message": "Hello from Docker!",
        "container_id": os.environ.get('HOSTNAME', 'unknown')
    })

@app.route('/health')
def health():
    return jsonify({"status": "healthy"})

if __name__ == '__main__':
    app.run(debug=True, host='0.0.0.0', port=5000)
```

requirements.txt:

```
Flask==2.3.3
```

Dockerfile:

```
FROM python:3.11-slim

WORKDIR /app

COPY requirements.txt .
RUN pip install --no-cache-dir -r requirements.txt

COPY app.py .

EXPOSE 5000

CMD ["python", "app.py"]
```

Task 4.2: Build and Test Image

1. Build the image:

```
docker build -t my-flask-app:v1.0 .
```

```

ubuntu@ip-172-31-35-192:~/flask-docker-app$ docker build -t my-flask-app:v1.0 .
DEPRECATED: The legacy builder is deprecated and will be removed in a future release.
             Install the buildx component to build images with BuildKit:
             https://docs.docker.com/go/buildx/

Sending build context to Docker daemon  4.096kB

ubuntu@ip-172-31-35-192:~/flask-docker-app$ curl localhost:5000
{
  "container_id": "b65310ab29e7",
  "message": "Hello from Docker!"
}
ubuntu@ip-172-31-35-192:~/flask-docker-app$ curl localhost:5000/health
{
  "status": "healthy"
}
ubuntu@ip-172-31-35-192:~/flask-docker-app$ |

```

Task 4.3: Multi-container Application

1. Create docker-compose.yml:

```

version: '3.8'
services:
  web:
    build: .
    ports:
      - "5000:5000"
    volumes:
      - app-logs:/app/logs
    networks:
      - app-network

  redis:
    image: redis:alpine
    networks:
      - app-network

volumes:
  app-logs:

networks:
  app-network:

```

2. Run with docker-compose:

```

docker-compose up -d
docker-compose ps

```

```

ubuntu@ip-172-31-35-192:~/flask-docker-app$ docker-compose up -d
Starting flask-docker-app_web_1 ...
Starting flask-docker-app_web_1 ... done
ubuntu@ip-172-31-35-192:~/flask-docker-app$ docker-compose ps

```

Name	Command	State	Ports
flask-docker-app_redis_1	docker-entrypoint.sh redis ...	Up	6379/tcp
flask-docker-app_web_1	python app.py	Up	0.0.0.0:5000->5000/tcp, :::5000->5000/tcp

```

ubuntu@ip-172-31-35-192:~/flask-docker-app$ |

```

Part 5: Image Registry (30 minutes)

Task 5.1: Push to Docker Hub

1. **Create Docker Hub account** (if you don't have one)
2. **Login to Docker Hub:**

```
docker login
```

3. **Tag and push image:**

```
docker tag my-flask-app:v1.0 yourusername/flask-demo:v1.0
docker push yourusername/flask-demo:v1.0
```

4. **Test pulling image:**

```
docker rmi my-flask-app:v1.0 yourusername/flask-demo:v1.0
docker run -d -p 5001:5000 yourusername/flask-demo:v1.0
```

```
ubuntu@ip-172-31-35-192:~/flask-docker-app$ docker login

```

Assignment Deliverables

1. Lab Report (Submit as PDF)

Create a document containing:

- Screenshots of each major task completion
- Answers to all questions posed in the tasks
- Docker commands used and their outputs
- Explanation of networking concepts learned

2. Code Repository

Create a Git repository with:

- Flask application code
- Dockerfile
- docker-compose.yml
- README.md with setup instructions

3. Reflection Questions (Answer in your report)

Container vs VM: Explain the key differences between Docker containers and virtual machines.

Ans:

- Containers are faster and lighter but less isolated; VMs are more secure but resource-intensive.
- Containers share the host OS kernel, VMs have their own complete OS
- Containers are more portable across environments, VMs are platform-specific

Networking: Why do containers in custom bridge networks have DNS resolution while default bridge network containers don't?

Ans:

- Custom bridge networks have an embedded DNS server, default bridge doesn't have dns.
- Custom networks automatically register container names as hostnames for DNS lookup
- Custom networks resolve container names to IP addresses automatically

Data Persistence: When would you choose bind mounts over Docker volumes and vice versa?

Ans:

- Bind mounts are used for development and direct file access; Docker volumes used for production and managed persistence.
- Bind mounts need specific hostfile path. Docker volumes means docker will manage the storage life cycle

Image Optimization: What strategies could you use to reduce Docker image size?

Ans:

- Multi-Stage build. That means use separate stages for build and runtime.
- Use distroless image. That means start with minimal base image instead of full OS Image.
- Minimize the docker layers.
- Only copy the required files. Do not copy the entire project

Security: What are three security best practices when building Docker images?

Ans:

- Run as non-root
- Scan for vulnerabilities
- Keep images minimal to reduce security risks.

Production Readiness: What additional considerations would you need for running containers in production?

Ans:

Production requires:

- Container orchestration
- Monitoring & Logging
- Security hardening
- High availability.

Bonus Challenges

Challenge 1: Multi-stage Build

Create a Dockerfile using multi-stage builds to reduce the final image size.

Challenge 2: Health Checks

Add health checks to your containers and demonstrate how they work.

Challenge 3: Container Monitoring

Set up basic monitoring for your containers using docker stats and logging.

Challenge 4: Environment Variables

Modify your Flask app to use environment variables for configuration and demonstrate different ways to pass them to containers.

Evaluation Criteria

Basic Tasks (70 points):

- Container management and interaction
- Networking configuration and testing
- Volume usage and data persistence
- Image building and running

Documentation (20 points):

- Clear explanations of concepts
- Well-documented commands and outputs
- Thoughtful answers to reflection questions

Code Quality (10 points):

- Clean, working application code
- Proper Dockerfile best practices
- Clear repository organization

Total: 100 points

Time Estimate: 3-4 hours
